CONVERSION FACTORS

For use of readers who prefer to use metric units, conversion factors for terms used in this report are listed below:

<u>Multiply</u>	<u>By</u>	<u>To obtain</u>
foot (ft)	0.3048	meter (m)
billion gallons per day (billion gal/d)	0.00004381	cubic meter per second (m^3/s)

National Geodetic Vertical Datum of 1929 (NGVD of 1929): A geodetic datum derived from a general adjustment of the first-order level nets of both the United States and Canada, called NGVD of 1929, is referred to as sea level in this report.

GROUND-WATER LEVELS IN THE ALLUVIAL AQUIFER

IN EASTERN ARKANSAS, 1984

by Maria Plafcan

ABSTRACT

This report, prepared by the U.S. Geological Survey in cooperation with the Arkansas Soil and Water Conservation Commission, the U.S. Soil Conservation Service and local Conservation Districts, contains ground-water level measurements in 485 wells tapping the Mississippi River Valley alluvial aquifer of eastern Arkansas. The measurements were made by district Soil Conservation Service personnel during 1985. The purpose of this report is to provide these data to other State and Federal agencies as well as to private landowners.

The shallowest pre-pumping water levels occurred in Clay, Independence, and Mississippi County where most water levels were within 20 feet of land surface. Counties where water levels of 100 feet below land surface or greater were measured included: Arkansas, Lonoke, Poinsett, and Prairie. Water-level measurements made during the post-pumping (recovery) season averaged 3.65 feet less than those made during the pre-pumping season. A comparison of pre-pumping water-level measurements made in 1984 to those made in 1985 shows an average rise of 1.0 foot within the area (Edds and Spencer, 1985).

INTRODUCTION

Rice production is important to the economy of eastern Arkansas and requires large quantities of freshwater for irrigation. The main source of this freshwater is from an aquifer (a water-bearing layer of sediment that will yield water in a usable quantity to a well or spring) contained in the Quaternary deposits of the Mississippi Alluvial Plain (fig. 1) called the Mississippi River Valley alluvial aquifer, henceforth referred to as the alluvial aquifer. Holland and Ludwig (1981) reported that approximately 3.4 billion gallons of water per day were removed from alluvial deposits in 1980, most of which were used for rice irrigation, thus emphasizing the importance of the alluvial aquifer.

This report was prepared as part of the East Arkansas Water Conservation Project, a cooperative effort with the Arkansas Soil and Water Conservation Commission (ASWCC), the U.S. Soil Conservation Service (SCS), and local Conservation Districts to conduct studies that would help further define the hydrologic characteristics of the alluvial aquifer. The U.S. Geological Survey (USGS) maintains a network of monitor wells in the alluvial aquifer in eastern Arkansas in cooperation with the Arkansas Geological Commission and has monitored the water levels each spring prior to the pumping season for several years. Reports containing these water-level data since 1981 include: Edds (1981, 1982, 1983, 1984), Edds and Fitzpatrick (1984), and Edds and Spencer (1985). In 1984 (Plafcan, 1985), the USGS network was enhanced by the network of monitor wells listed herein in the alluvial aquifer measured by district Soil Conservation Service personnel with technical advice and coordination provided by the USGS. The purpose of this report is

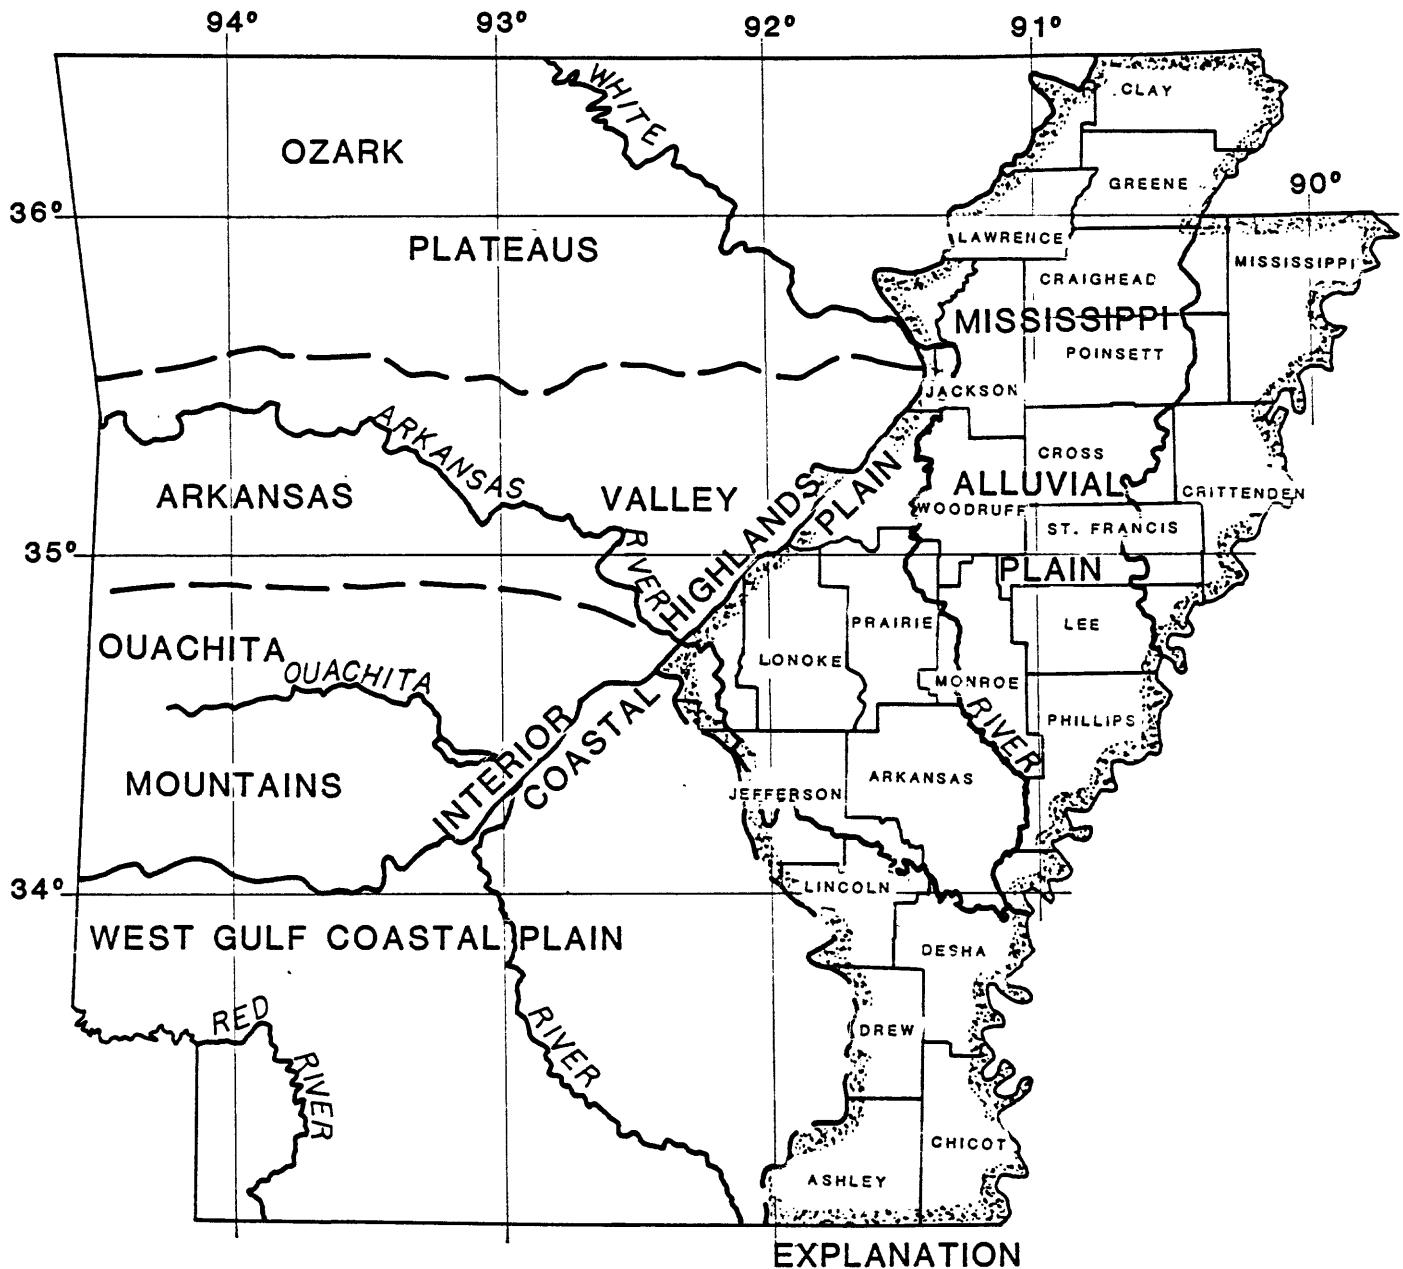

Figure 1.--Location of study area.

to present results of water-level measurements made by the SCS personnel before and after the pumping season of 1985 and to provide these data to other State and Federal agencies as well as to private landowners.

The water levels in 485 wells in the alluvial aquifer recorded in table 1 reflect the pre-pumping and post-pumping conditions during 1985, and will be used in conjunction with measurements made by the USGS to prepare maps showing water levels, depth to water, and 5-year net change of water levels in eastern Arkansas for 1985. These water-level measurements are not stored in the USGS's WATSTORE ground-water file system but are stored in local computer files of the USGS.

The shallowest pre-pumping water levels occurred in Clay, Independence, and Mississippi County where most water levels were within 20 feet of land surface. Counties where water levels of 100 feet below land surface or greater were measured included: Arkansas, Lonoke, Poinsett, and Prairie. Water-level measurements made during the post-pumping (recovery) season averaged 3.65 feet less than those made during the pre-pumping season. A comparison of pre-pumping water-level measurements made in 1984 to those made in 1985 shows an average rise of 1.0 foot within the area (Edds and Spencer, 1985).

DATA

Table headings used in the report are defined as follows:

Location: Township, range, and section number designation of well.

Altitude of land surface: Altitude of the land surface at the well, in feet above sea level. The altitudes were estimated from topographic maps and are accurate to within 2.5 feet.

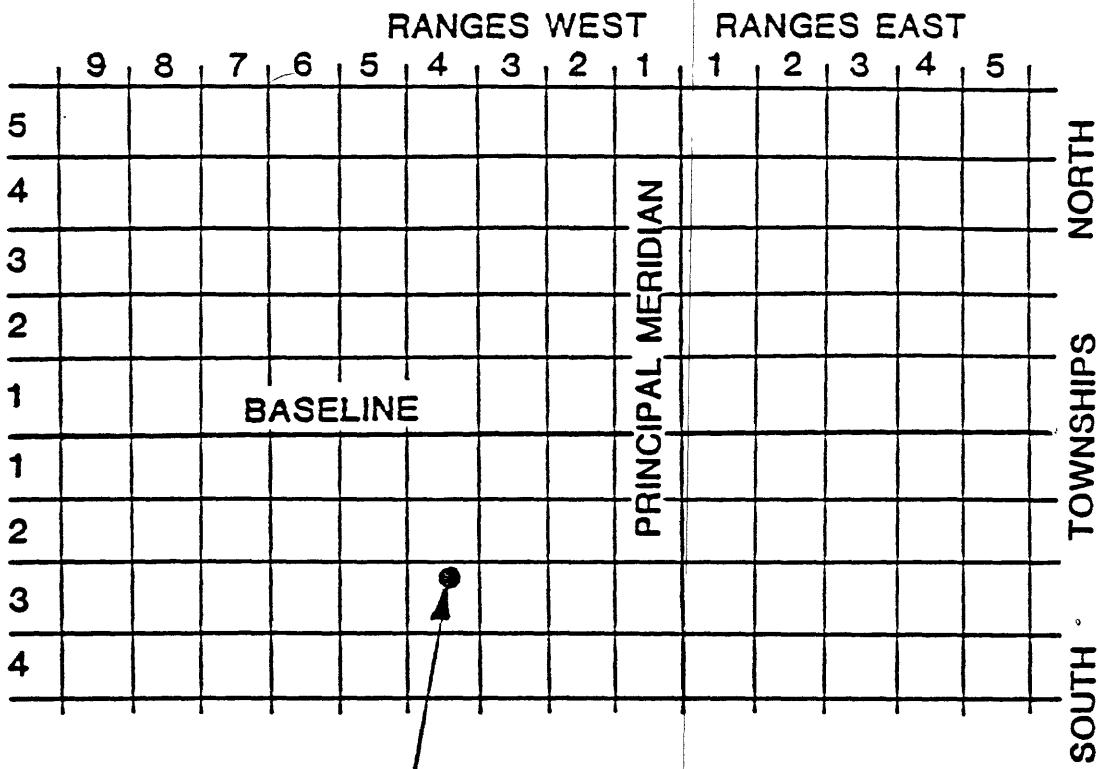

Depth to water below land surface: Measured depth to water, in feet below land surface. Measurements were made with a chalked steel tape and are accurate to within 0.10 foot.

Altitude of water level: Altitude of water level, in feet, above or below sea level.

Net change: Difference in feet between the spring and fall 1985 altitude of water level. Symbol preceding number indicates a decline (-) in water levels in the well during the period.

WELL-NUMBERING SYSTEM

The well-numbering system used in this report is based upon the location of the wells according to the federal land survey used in Arkansas. The component parts of a well number are the township number, the range number, the section number, and three letters which indicate, respectively, the quarter section, the quarter-quarter section, and the quarter-quarter-quarter section in which the well is located. The letters are assigned counterclockwise, beginning with "A" in the northeast quarter or quarter-quarter or quarter-quarter-quarter section in which the well is located. For example, well 03S04W03DCAl6 (fig. 2) is located in Township 3 South, Range 4 West, and in the northeast quarter of the southwest quarter of the southeast quarter of section 3. This well is the 16th well in this quarter-quarter-quarter section of section 3 from which data were collected.
